Almatris Calcium Aluminate Cement production reduces carbon footprint significantly

Almatris is walking the talk and leading the transformation of the industry towards carbon neutrality.

Almatris is proud to announce that the verified product carbon footprint values for our Calcium Aluminate Cement products has been reduced. The **carbon footprint reductions achieved are 5-20%**, depending on the product, which represents a significant improvement from our baseline year. The calculations have been verified according to the Greenhouse Gas (GHG) Protocol Standard, also following closely with the ISO 14067 Standard.

Sustainability is a key component of Almatris long-term corporate strategy. Almatris sustainability program, **Mission NeutrAL**, outlines our **Ambition** for a sustainable raw material industry, our **Commitment** towards sustainability initiatives and **Transparency** with our sustainability performance. Together, these key pillars support our mission to provide the lowest delivered carbon footprint for alumina products to our core markets.

Almatris corporate and product carbon accounting methodology is also verified to the ISO 14064-3 Standard. Verification according to these methodologies significantly reduces the amount of time required to calculate, audit and verify the ongoing product carbon footprint of all product lines across our global operations.

Feel free to contact your regional account manager or send a message to our team at info@almatris.com to receive the verified values of specifically sourced products.
